Overview

Mail Exporter Pro is an easy to use and high performance utility to export your Apple Mail data into Microsoft Outlook for Mac 2011, Microsoft® Entourage Archive and common standard formats [MBOX (.mbox) or EML (.eml)] so that it can be migrated to Microsoft Outlook (for Mac) 2011, Microsoft® Entourage 2004/2008, Mozilla Thunderbird, Postbox or any other software application which supports import from these formats on variety of platforms.

Some salient features of “Mail Exporter Pro” are:

1. Easy to use Wizard interface.

We have carefully designed its user interface to ensure that you find it simple and effectively easy to use. Just follow self-explanatory wizard screens and get it done!

2. Can handle multiple sources.

Whether you have Apple Mail configured with your email address or your Apple Mail database backed up on a disk, Mail Exporter Pro will process it on your choice. It can also process “Apple Mail Archives” which you may have exported earlier.

3. Export Apple Mail to Outlook for Mac 2011 or Entourage.

Export your Apple Mail to Microsoft Outlook for Mac 2011 or Microsoft Entourage in few easy steps. It is completely hassle free and saves you a lot of time in migrating from Apple Mail to Outlook or Entourage. Your folder hierarchy and attachments are preserved. Unicode data (email content in any language) is also preserved.

What else? Mail Exporter Pro is able to automatically import your Apple Mail data into Microsoft Outlook for Mac 2011 (*automatic import functionality works with Outlook 14.2.2 or later*). Just run through the Mail Exporter Pro Wizard and that's it.

4. Convert your EMLX files to EML file more reliably than any other utility.

Apple Mail stores emails in **emlx** file format. Sometimes attachments are stored in **emlxpart** files. Mail Exporter Pro is capable of correctly processing all **emlxpart** attachments. We compared it with many other utilities and found that other tools can handle only one level of **emlxpart** attachments. But Mail Exporter Pro can correctly handle multilevel or nested **emlxpart** attachments. It can also detect corrupt emails and un-cached attachments and produces a detailed log report for your valuable emails.

5. High Performance Tool! Runs directly on your Mac!

We have taken utmost care to make “Mail Exporter Pro” faster than any other way to migrate Apple Mail database. And yes! It runs directly on your Mac. Forget about multi step and tedious Windows based solutions for Apple Mail or **emlx** file conversion. Do it on your Mac and just get it done like a Pro!

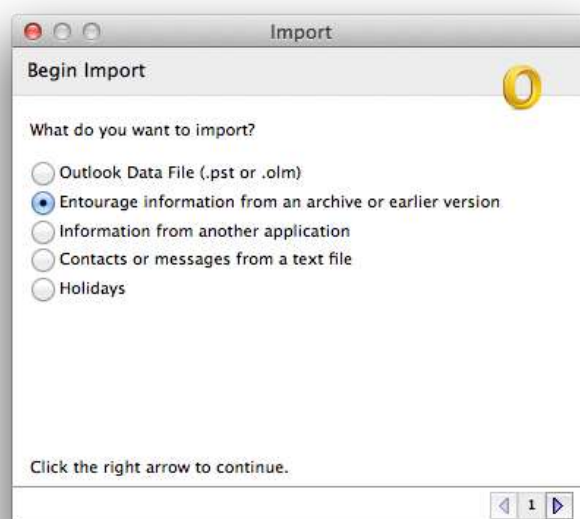

Migrating Apple Mail to Outlook for Mac 2011

Launch Mail Exporter Pro wizard and run through it. Remember to choose “Microsoft® Outlook® for Mac 2011 or Entourage” option in target selection dialog.

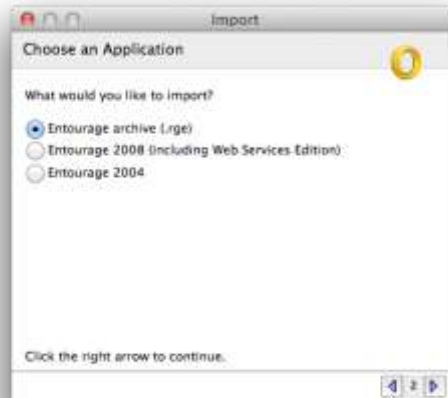

When you click “Next” button, next dialog appears and asks if you want to automatically import your emails into Outlook 2011 (This functionality works with Outlook version 14.2.2 or later). If yes then just follow onscreen wizard. But if you have older version of Outlook or Microsoft Entourage then you may choose not to import the converted e-mails automatically. Here you can choose the option “Save Microsoft Entourage Archive (.rge)” and save the converted archive file (.rge) file on disk. Once you have finished exporting .rge file, please follow these steps:

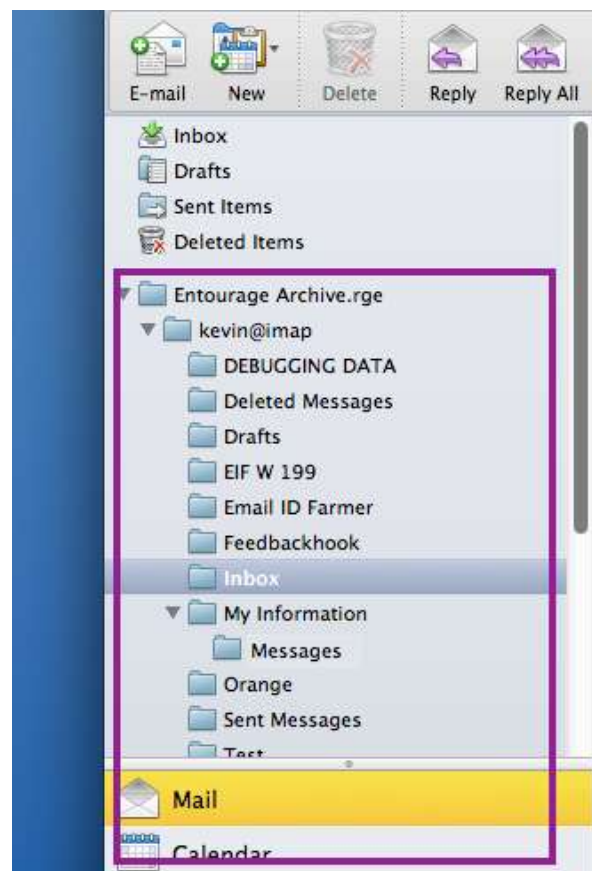

- 1) Launch Outlook 2011 on your Mac. Choose Menu “File → Import”.
- 2) Select option “Entourage information from an archive or earlier version” in import dialog. Click on small “Next” (triangle at right bottom corner of the dialog.)

- 3) Choose the option “Entourage Archive (.rge)” and click Next (Triangle button at right bottom corner)

- 4) Select the archive (.rge) file in file open selection dialog and click “Import”. Wait for the import process to finish. Imported emails can be located in left pane in Outlook’s Main Window (as shown in following figure.) And you are done !

Migrating Apple Mail to Thunderbird (Mac or Windows version).

Thunderbird already supports import from Apple Mail but we have noticed that this functionality does not work sometimes. You may also plan to migrate from Mac Apple Mail to Thunderbird (Windows version). So Mail Exporter Pro provides a more reliable way to migrate your emails from Apple Mail to Thunderbird.

Run through Mail Exporter Pro wizard and remember to choose “EML (*.eml) Files” option in target selection dialog.

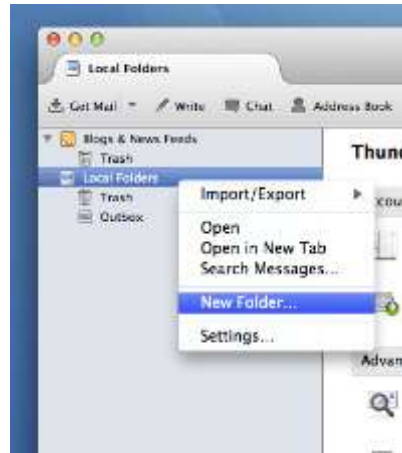

Click “Next” and create a new output folder on your desktop in folder selection dialog. Choose it as output folder and wait till the export process finishes. If you want to import it on another Mac or Windows computer then copy the output folder to your destination Machine.

Now launch Thunderbird on your target machine and follow these steps (same for Mac as well as Windows)

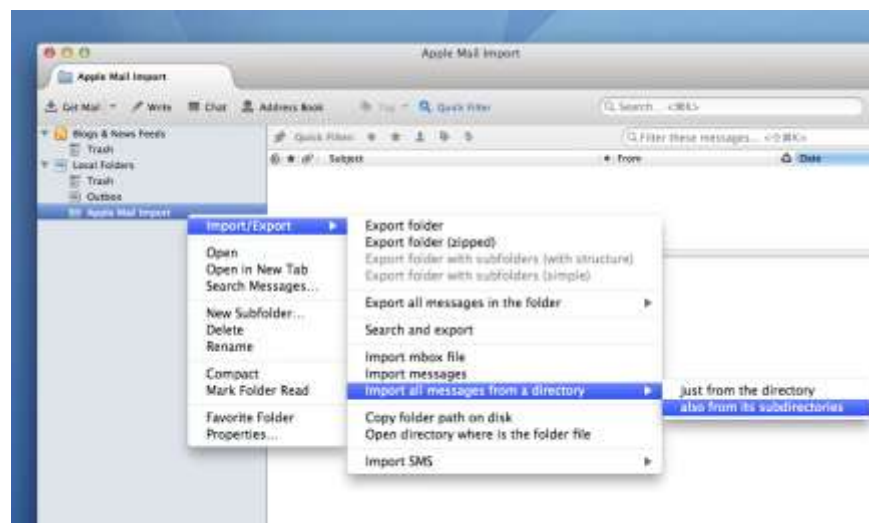

- 1) Go to Thunderbird menu “Tools → Add-ons”. Search for “ImportExportTools” and click “Install” button. After installation of this tool, please restart Thunderbird. Following figure is for illustration purpose. There may be some other version of ImportExportTools available on web. That would also work same.

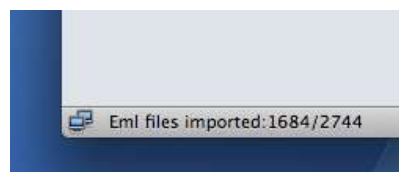

- 2) Now click on “Local Folders” in folder view and right click (ctrl + click) on it. Select “New Folder...” and provide name (say Apple Mail Import) for new folder.

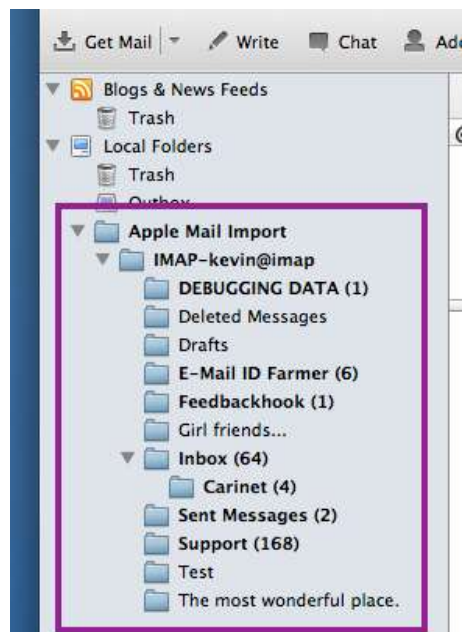

- 3) Right click on your newly created folder and choose context menu option “Import/Export → Import all messages from a directory → also from its subdirectories” as show in following figure.

- 4) Select the output folder, which contains exported eml files from Mail Exporter Pro. Just select the folder root and don't go deeper in folder hierarchy. Click “open”. Thunderbird starts importing your “Eml” files along with the folder hierarchy. You can monitor the import progress in Thunderbird's status bar as shown in following figure.

- 5) You can locate imported email in left side pane of Thunderbird. Done !
